Distances to methanol masers

EVN programme of phase referencing at 6.7GHz

9th EVN Symposium, Bologna

Kazi Rygl, Andreas Brunthaler, Karl Menten, Mark
Reid and Huib Jan van Langevelde

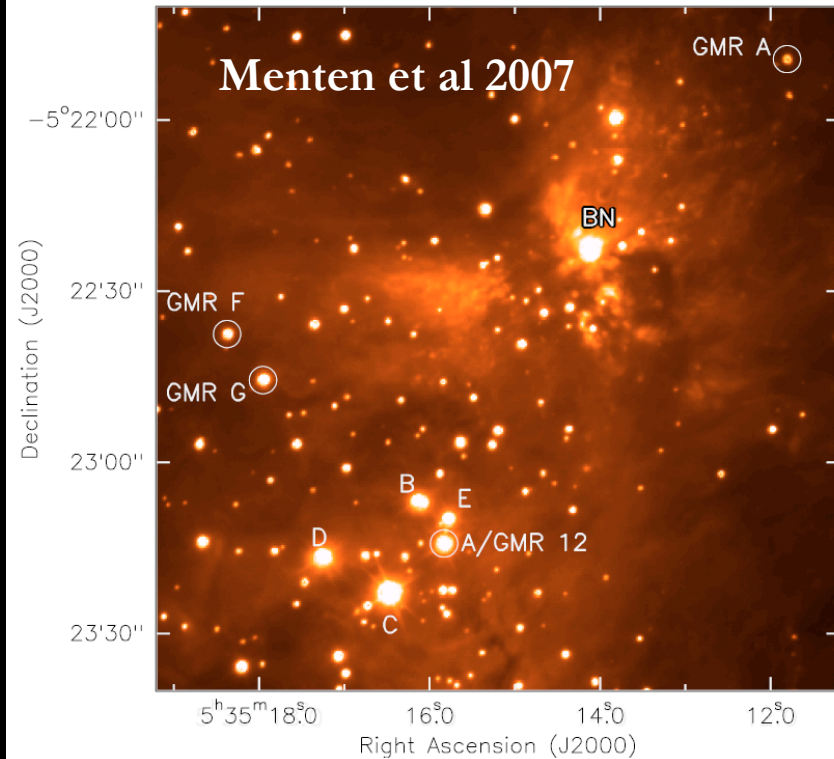

Kazi Rygl is member of the IMPRS for Astronomy & Astrophysics

Why are reliable distances important?

Spitzer starcounts + maser
distances

Robert Benjamin,
University of Wisconsin

Parallax: optical and radio

Optical: Hipparcos & GAIA

- ❖ Hipparcos: accuracy: 0.8-2 mas, distances till 200 pc (error 20%)
- ❖ GAIA (2011): accuracy $\sim 20 \mu\text{as}$, more sensitive to fainter stars

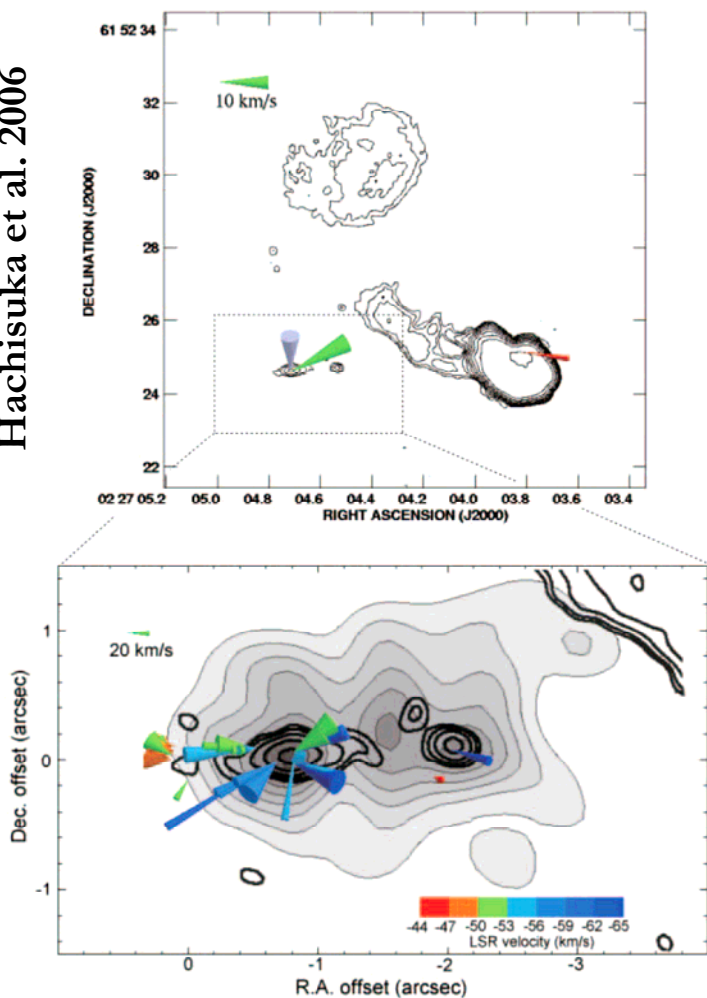

Radio: no extinction of dust!

- ❖ VLBI: accuracy of ~ 100 - $10 \mu\text{as}$ for accurate distances to 1 – 10 kpc (errorbar 10%)
- ❖ Masers in SFR/AGB stars are strong compact sources for VLBI

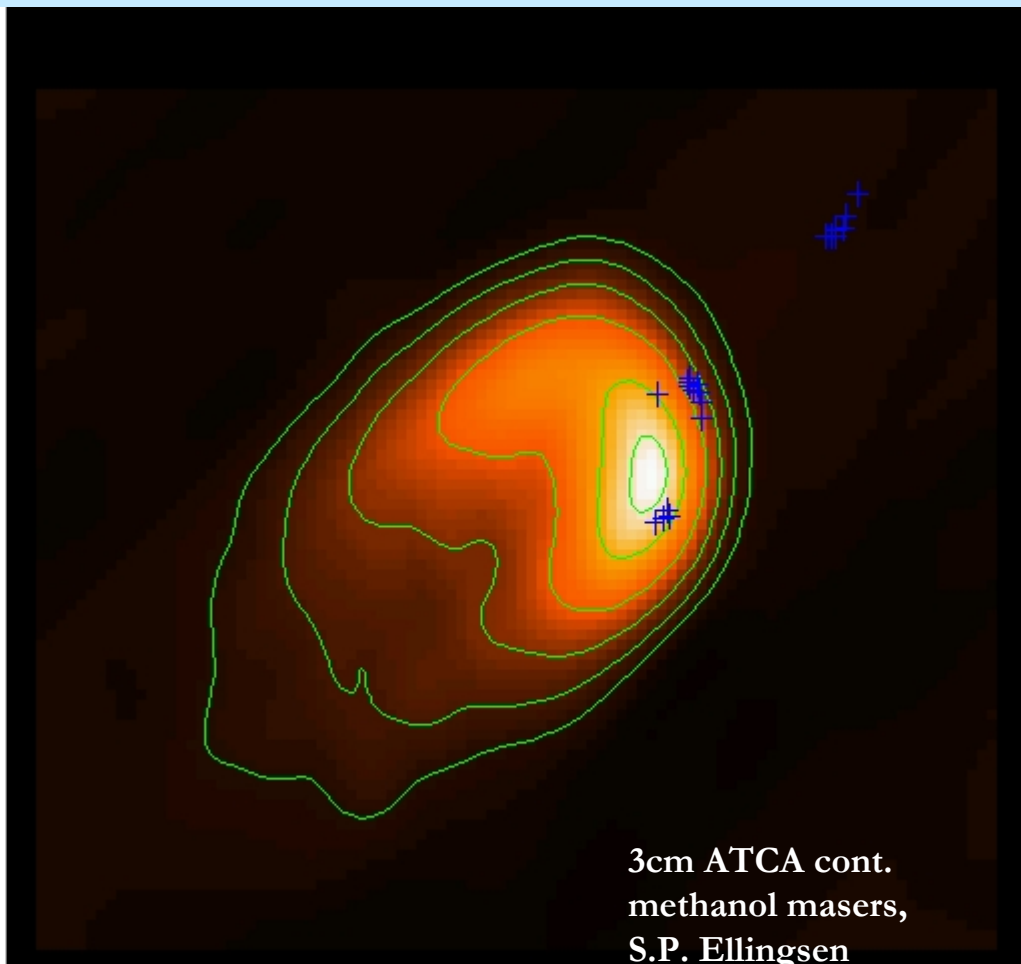

Masers for Parallax

Water masers

Hachisuka et al. 2006

Methanol masers

Methanol masers in MSFR of the Perseus Arm

- 8 well known MSFR: L1206, L1278, ON1, NGC281-W, S255, S252, S269 and MONR2
- 5 epochs of EVN observations
- 1 epoch = 24 hours
- Geodetic-like observations
- Phase referencing on maser

NGC 281: [SII] = Red, H-alpha = Green,
[OIII] = Blue

Results 1: S255

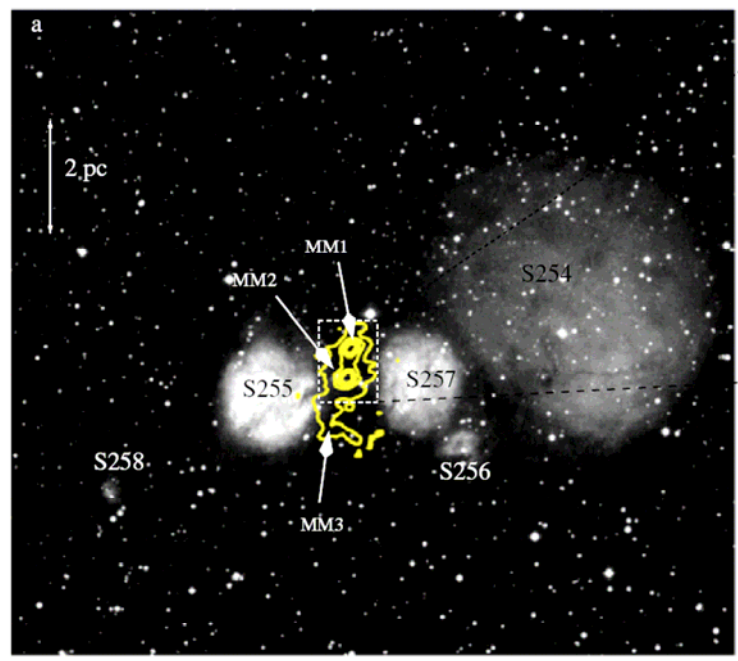

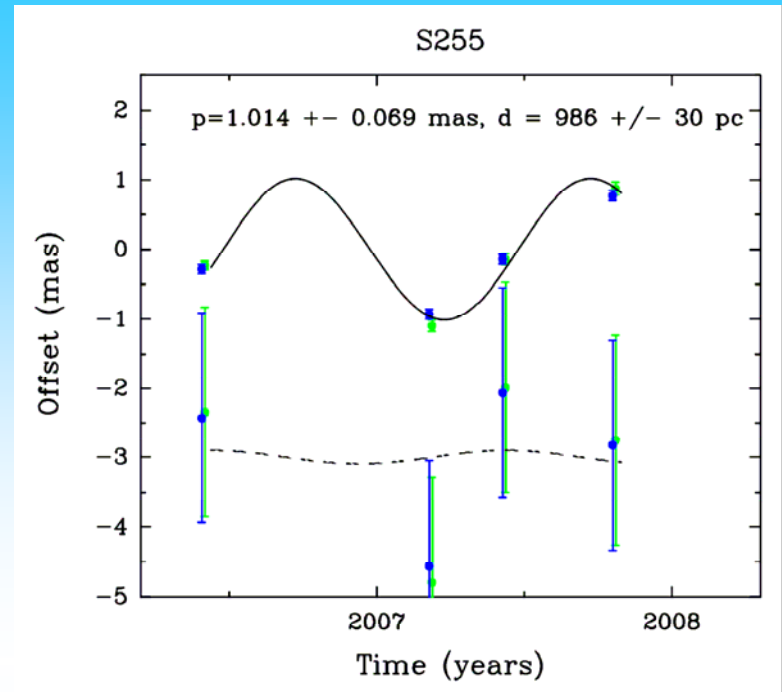

Minier : $d=2.5$ kpc for MM1 and MM2

Clump mass 300 Msun, Luminosity $5-10 \cdot 10^4$ Lsun (in 0.3pc)

With $d = 986$ pc,

Mass 48 Msun (estimated from 1.2 mm flux),

Luminosity $8-16 \cdot 10^3$ Lsun (in 0.75 pc)

DSS optical image with 1.2 mm dust continuum contours.
HCO+(3-2) line spectra.

(Minier et al 2007)

Results: L1287

MSFR with a collimated outflow,
CO line wings – Yang et al 1991
Kinematic distance (NH_3) 850 pc

Our result: 891 ± 48 pc

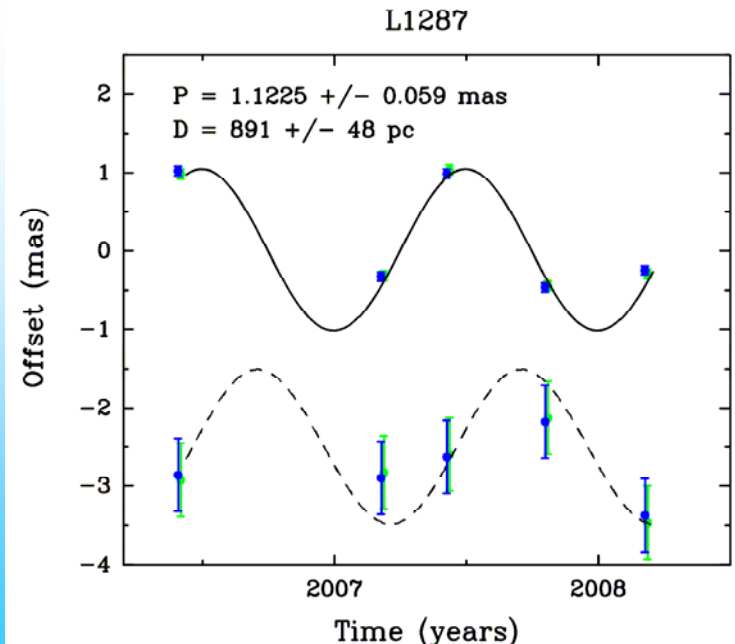

FIG. 4.—High-velocity CO emission in L1287 (Yang et al. 1991) superposed on the $\text{NH}_3(1, 1)$ emission above the half-power level (Fig. 3).

Results & work in progress: S269

- S269 at a distance of 5.3 kpc (Honma et al. 2007, water maser, 6 epochs, 9h), our accuracy is not enough to detect this parallax (5 epochs, ~ 1.2 h)
- Proper motions – methanol masers are more ‘stable’
We can try to verify proper motion of Honma et al.

Summary of distance results

SFR	D_{par} (kpc)	err	D_{kin} (kpc)	Literture D (kpc)
L1287	0.891	5%	0.85	D_{kin} , Estalella et al. 1993
ON1	1.75	10%	1.8	D_{kin} MacLeod et al. 1998
S255	0.986	2%	1.1	2.5 Minier et al. 2007
NGC281-W	2.55	31%	2.7	2.8 Sato et al. 2008, parallax
S269	--	--	3.0	5.3 Honma 2007, parallax
S252	--	--	4.4	2.1 Reid 2008, parallax
L1206	t.b.d	t.b.d	1.3	
MONR2	t.b.d	t.b.d	0.94	

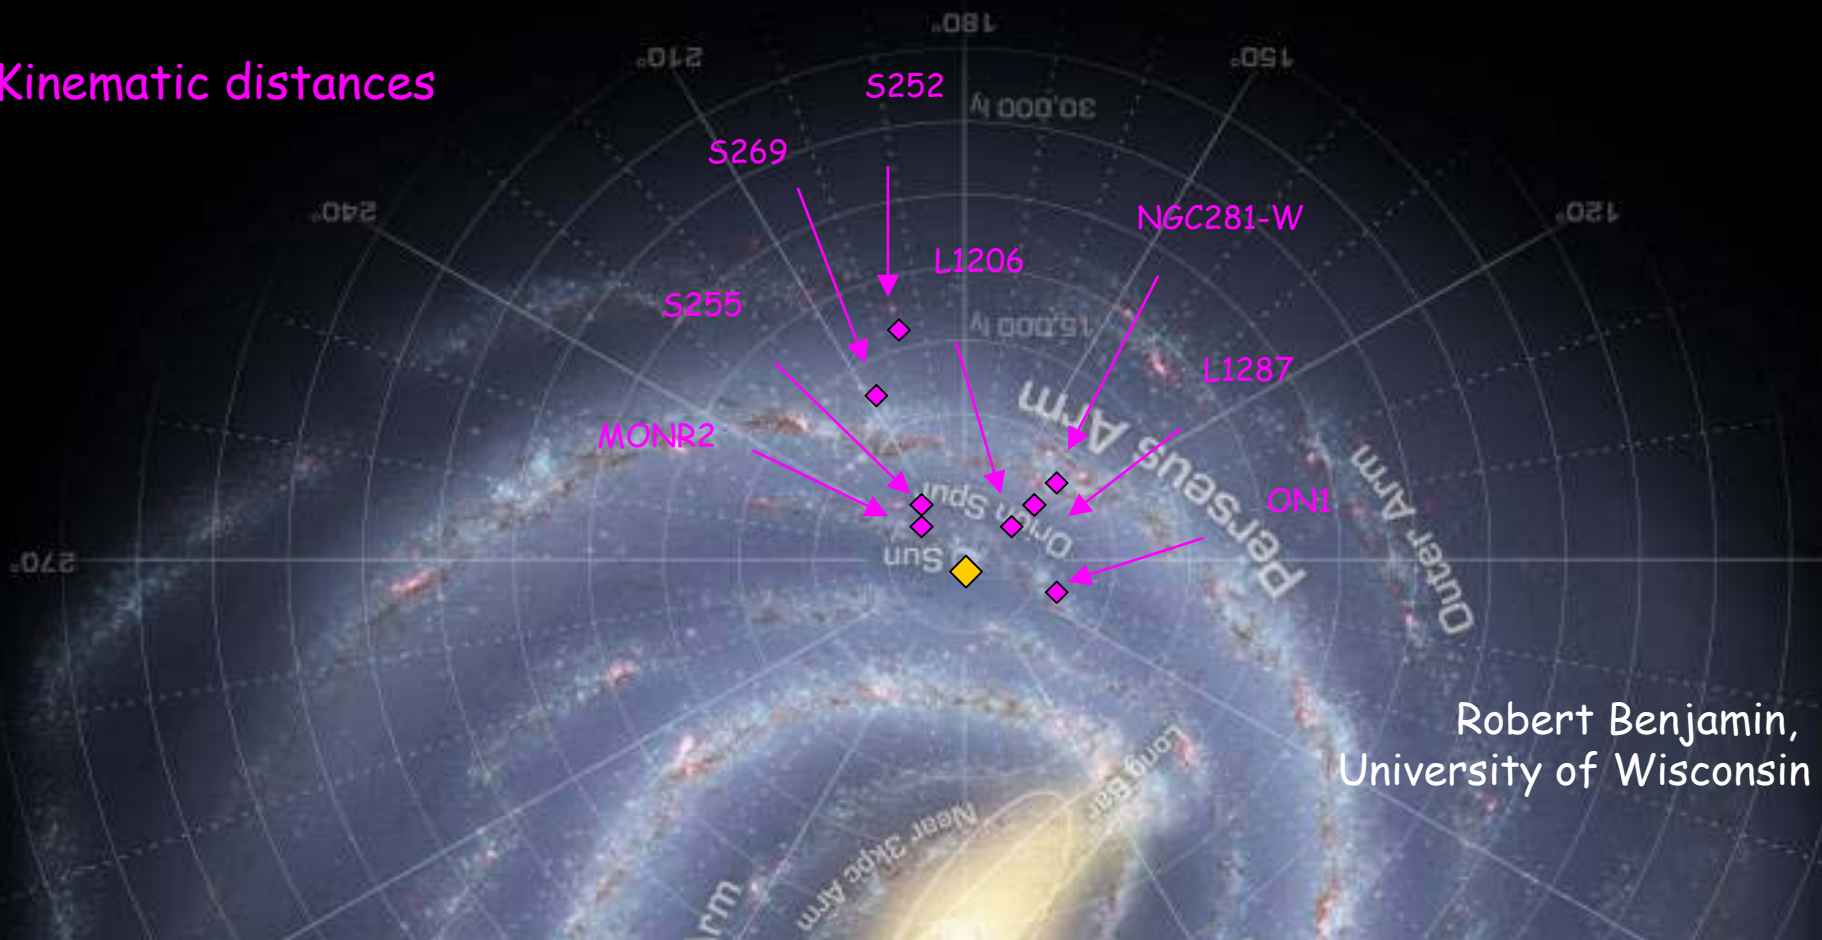

Discussion

- i. Good results (error $\leq 10\%$) for sources $\delta > 20$ deg up to a distance of ~ 2 kpc (at 2.5 kpc we have errorbars of 31%)
- ii. Accuracy of $\sim 50 - 100 \mu\text{as}$ (10-20 x better than Hipparcos)
- iii. Covering the peaks of parallax signal improves accuracy
- iv. Low declinations ($\delta < 17$ deg) had too few time for a good uv coverage
- v. Parallax signature in declination suffers more atmosphere
- vi. At 6.7 GHz tropospheric calibrations work in most cases, why not always? ionospheric delay ?

Future prospects

- 3D velocities to study the movement of the MSFR against a Galactic motion
- A review of the MSFRs with a 'new' distance

Kinematic distances

Thank you for your attention!
